

INTO THE AI JUNGLE

Codex Master Prompt + Build Brief

Interactive website for the English final project: Artificial Intelligence: Friend or Threat?

Approved direction: cinematic jungle, subtle technology, warm gold trail light, premium UI, floating techno-cat guide named Byte. Avoid the cheap “neon AI dashboard” look.

Visual reference only. The final website should be cleaner, responsive, and built as real HTML/CSS components. Do not place text inside generated images.

1. Что делать прямо сейчас

- Создать GitHub репозиторий: ai-jungle или into-the-ai-jungle.
- Создать локальный проект Next.js + TypeScript + Tailwind CSS.
- Добавить файл AGENTS.md в корень проекта. Это будет постоянная инструкция для Codex.
- Создать папку public/images и положить туда фоны, кота и временные placeholder-картинки.
- Открыть Codex и дать ему Master Prompt из этого документа.
- Сначала попросить Codex собрать рабочий MVP: имя, кот Byte, 4 зоны, выборы, score, final verdict.
- Только после рабочей логики просить улучшать визуал, анимации и Presentation Mode.

Folder/File	Purpose
AGENTS.md	Reusable project instructions for Codex. Put design rules, stack, component rules, and “do not” rules here.
README.md	Short project description for GitHub and for your teacher if needed.
public/images/	All generated backgrounds, Byte cat image, textures, and fallback placeholders.
src/data/zones.ts	All content for zones, choices, explanations.
src/data/catMessages.ts	All predefined Byte responses. Byte is not real AI.
src/lib/verdict.ts	Final score and verdict calculation.

2. Как работать с изображениями

Картинки не надо “объяснять” Codex словами каждый раз. Правильнее положить их в проект с точными именами, а в prompt и AGENTS.md указать, как их использовать. Codex увидит файлы в репозитории и сможет подключить их как background images или обычные изображения.

Asset	Recommended path	Usage
Hero jungle background	public/images/hero-jungle.webp	Full-screen background for the first section.
Education zone	public/images/zone-education.webp	Background for Education checkpoint.
Healthcare zone	public/images/zone-healthcare.webp	Background for Healthcare checkpoint.
Business zone	public/images/zone-business.webp	Background for Business checkpoint.
Daily life zone	public/images/zone-daily-life.webp	Background for Daily Life checkpoint.
Final temple	public/images/final-temple.webp	Final verdict section background.
Techno-cat Byte	public/images/byte-cat.png	Floating companion. Prefer transparent PNG.
Fog overlay	public/images/fog-overlay.webp	Optional decorative overlay.
Noise texture	public/images/noise.png	Optional subtle texture overlay.

Image generation rules:

- Generate backgrounds without text, logos, buttons, captions, or UI labels.
- Use wide 16:9 or 21:9 compositions for backgrounds. Recommended size: 1920x1080 or larger.
- Keep the central area relatively clean so HTML text can be readable on top.
- Use consistent cinematic jungle lighting: dark forest, warm gold light, soft emerald accents, low neon.

- For Byte, use transparent PNG if possible. If transparent is not possible, use a clean dark background and crop it.
- After adding final images, keep the same filenames so Codex does not need to rewrite many imports.

```
// Example image mapping file: src/data/assets.ts
export const assets = {
  hero: "/images/hero-jungle.webp",
  education: "/images/zone-education.webp",
  healthcare: "/images/zone-healthcare.webp",
  business: "/images/zone-business.webp",
  dailyLife: "/images/zone-daily-life.webp",
  finalTemple: "/images/final-temple.webp",
  byteCat: "/images/byte-cat.png",
  fog: "/images/fog-overlay.webp",
  noise: "/images/noise.png",
};
```

3. Master Prompt for Codex

Copy this whole section into Codex as the first major task. Keep it in English because the project code, text content, and presentation are in English.

You are building a real website for an English course final project.

Project title: “Into the AI Jungle”.

Main topic: “Artificial Intelligence: Friend or Threat?”

The website must be an interactive educational product, not a normal quiz and not a static presentation.

It should feel like a cinematic jungle expedition where the user is guided through the opportunities and risks of artificial intelligence.

IMPORTANT HIGH-LEVEL GOAL

The user should experience this flow:

Name input → Techno-cat guide Byte → Jungle journey → 4 AI zones → choices → consequences → scores → final verdict.

The website must cover these required topic areas:

1. Education
2. Healthcare
3. Business
4. Daily Life

For each area, show both opportunities and risks of AI.

The final message should be balanced:

AI is a friend when it supports people.

AI is a threat when it replaces human thinking, privacy, honesty, or responsibility.

TECH STACK

Use:

- Next.js App Router
- TypeScript
- Tailwind CSS
- Framer Motion

No backend is required for the first version.

All interactions can run on the frontend with React state and localStorage.
The project must be easy to deploy on Vercel and stored on GitHub.

VISUAL STYLE

Use a cinematic dark jungle aesthetic with subtle technology.
The visual direction is premium, atmospheric, and readable.
It should NOT look like a cheap neon cyberpunk dashboard.

Approved style:

- Dark cinematic jungle
- Warm gold trail light
- Soft emerald details
- Dark glass cards
- Large readable typography
- Clean spacing
- Subtle particles, fog, and glow
- Minimal navigation
- Smooth transitions
- Storytelling layout
- High contrast for projector presentation

Avoid:

- Heavy neon everywhere
- Overloaded dashboard UI
- Too many glowing borders
- Tiny unreadable text
- Random gradients
- Text embedded inside images
- Too many cards on one screen
- Generic AI robot/circuit look
- Cyberpunk city style

COLOR SYSTEM

Use CSS variables or Tailwind tokens:

- Background: deep forest black / dark green
- Primary accent: warm jungle gold
- Secondary accent: soft emerald
- Danger accent: muted red
- Text: soft white, not pure white
- Cards: dark glass with low opacity

Suggested palette:

- forest-black: #0b0f0a
- deep-green: #122a20
- moss-green: #203e2b
- trail-gold: #d9b44a
- soft-gold: #efe6c6
- emerald: #8bcf88
- muted-red: #b95d40
- glass-dark: rgba(8, 14, 10, 0.72)
- border-soft: rgba(239, 230, 198, 0.22)

TYPOGRAPHY

Use a cinematic serif or display font for headings if available through CSS/imports, and a clean sans-serif for body text.
Fallback is acceptable.

Headings should feel premium and readable.

Body text must be clear for B1-level English students.

REQUIRED USER EXPERIENCE

1. Hero / Entrance section

- Full-screen cinematic jungle background.
- Title: “Into the AI Jungle”
- Subtitle: “A digital journey through the opportunities and risks of artificial intelligence.”
- Ask for user name: “What is your name, explorer?”
- Input field: “Enter your name...”
- Button: “Start the Journey”
- The user cannot start with an empty name; if empty, use “Explorer” as fallback.

2. Save name

- Save userName in React state.
- Save userName in localStorage.
- If user returns later, load saved name.

3. Techno-cat guide Byte

- Add a floating companion component named Byte.
- Byte should appear as a small techno-cat image from /public/images/byte-cat.png.
- Byte floats gently using Framer Motion.
- Byte shows a speech bubble.
- Byte addresses the user by name.
- Byte is NOT a real AI. It uses predefined responses only.

4. Journey Map

- Show a vertical or side journey map with checkpoints:
 - Entrance
 - Education — The Classroom Ruins
 - Healthcare — The Healing Camp
 - Business — The Market of Machines
 - Daily Life — The Mirror Lake
 - Final Temple
- Highlight completed checkpoints.
- Current checkpoint should look active.

5. AI Compass

- Sticky compact score panel.
- Shows:
 - Friend Score
 - Threat Score
 - Responsibility Score
- Scores update after choices.
- It should look like a compass/metaphorical decision meter, not a boring chart.

6. Four checkpoint sections

Each checkpoint must contain:

- Area title
- Place name
- Short explanation of AI opportunity and risk
- One main situation
- Two choices:
 - Responsible Use
 - Dangerous Use

- After user selects a choice, show:

- a) short consequence
- b) Byte comment
- c) score update
- d) visual reaction

7. Choice reactions

Responsible choice:

- increase friendScore
- increase responsibilityScore
- soft gold/emerald glow
- positive Byte comment

Dangerous choice:

- increase threatScore
- reduce or do not increase responsibilityScore
- subtle muted-red warning/glitch
- warning Byte comment

8. Final Temple

- Final background: /images/final-temple.webp
- Show final verdict based on score:
 - “AI is a friend” if responsible/friend choices dominate strongly.
 - “AI is a threat” if dangerous/threat choices dominate strongly.
 - “AI is both” if mixed or balanced.
- Show final text:
 - “AI is a friend when it supports people. AI is a threat when it replaces human thinking, privacy, and responsibility.”
- Show “5 Laws of the AI Jungle”:
 1. Use AI as a tool, not as a replacement for thinking.
 2. Check information before trusting it.
 3. Protect personal data.
 4. Keep humans in control of serious decisions.
 5. Use AI responsibly and honestly.
- Add buttons:
 - Restart Journey
 - Download Badge or Show Badge (optional)

9. Presentation Mode

Add a button: “Presentation Mode”.

When enabled:

- Larger text
- Reduced motion
- Stronger contrast
- Cleaner layout
- More stable for projector screen
- Optional section-by-section navigation

10. Responsive design

Must work on laptop and mobile.

On mobile, the map and compass can collapse.

Text must remain readable.

COMPONENT STRUCTURE

Create these components:

- Hero.tsx

- NameIntro.tsx
- TechnoCat.tsx
- JourneyMap.tsx
- Checkpoint.tsx
- ChoiceCard.tsx
- AICompass.tsx
- FinalVerdict.tsx
- PresentationModeToggle.tsx

DATA STRUCTURE

Create:

- src/data/zones.ts
- src/data/catMessages.ts
- src/data/assets.ts
- src/lib/verdict.ts

Use data-driven rendering. Do not hard-code all checkpoint text inside components.

CONTENT FOR ZONES

Use this content in zones.ts:

Education:

Area title: Education

Place name: The Classroom Ruins

Question: You have to write an essay. How will you use AI?

Opportunity: AI can explain difficult topics, check grammar, and create practice exercises.

Risk: Students may use AI to cheat and stop thinking independently.

Responsible choice: Use AI to understand the topic and write the essay yourself.

Dangerous choice: Ask AI to write everything and submit it as your own work.

Responsible consequence: AI supports learning and helps the student improve.

Dangerous consequence: AI replaces learning and weakens critical thinking.

Healthcare:

Area title: Healthcare

Place name: The Healing Camp

Question: A doctor uses AI to analyze a medical image. What should happen next?

Opportunity: AI can help doctors analyze data and detect diseases earlier.

Risk: AI can make mistakes, and private medical data can be misused.

Responsible choice: The doctor checks the result and makes the final decision.

Dangerous choice: The AI makes the medical decision alone.

Responsible consequence: AI supports doctors while humans stay in control.

Dangerous consequence: Serious medical decisions become risky without human judgment.

Business:

Area title: Business

Place name: The Market of Machines

Question: A company wants to use AI to save time. What is the responsible way?

Opportunity: AI helps companies save time, answer customer questions, and analyze sales.

Risk: AI can replace jobs and collect too much customer data.

Responsible choice: Use AI for simple tasks and train workers for new skills.

Dangerous choice: Replace workers immediately without support or training.

Responsible consequence: AI improves efficiency while people are protected.

Dangerous consequence: AI becomes a threat to workers and trust.

Daily Life:

Area title: Daily Life

Place name: The Mirror Lake

Question: You see shocking news online that may be generated by AI. What will you do?

Opportunity: AI helps with navigation, translation, recommendations, and daily tasks.

Risk: People may become dependent on AI or believe false information.

Responsible choice: Check the source before believing or sharing it.

Dangerous choice: Share it immediately without checking.

Responsible consequence: Critical thinking protects the user from fake information.

Dangerous consequence: Fake information spreads faster and becomes dangerous.

BYTE MESSAGES

Create catMessages.ts with predefined messages. Byte must address the user by name.

Example functions:

intro(name): “Welcome, {name}. I’m Byte, your techno-cat guide. The AI Jungle is beautiful, but every choice matters.”

education.responsible(name): “Smart move, {name}. AI is a friend when it helps you learn, not when it replaces your work.”

education.dangerous(name): “Careful, {name}. That is the dangerous path. AI should not replace your own thinking.”

healthcare.responsible(name): “Good decision, {name}. In healthcare, AI should support doctors, but humans must make the final decision.”

healthcare.dangerous(name): “Warning, {name}. Medical decisions are too serious for AI alone. Human control is necessary.”

business.responsible(name): “Responsible choice, {name}. AI can save time, but companies should also protect workers and train them for new skills.”

business.dangerous(name): “Risk detected, {name}. Replacing people without support can make AI a threat.”

dailyLife.responsible(name): “Nice, {name}. AI is useful in daily life, but checking information keeps you safe.”

dailyLife.dangerous(name): “Be careful, {name}. Not every smart answer is a true answer.”

final.both(name): “You survived the AI Jungle, {name}. Remember: AI is not the monster here. The real danger is using it without responsibility.”

final.friend(name): “You found the responsible path, {name}. AI becomes a friend when people stay honest and in control.”

final.threat(name): “The jungle warned you, {name}. AI becomes a threat when people use it without responsibility.”

SCORING LOGIC

For each responsible choice:

- friendScore += 20

- responsibilityScore += 20

For each dangerous choice:

- threatScore += 20

- responsibilityScore -= 5 or stays the same

Responsibility score should be clamped from 0 to 100.

Final verdict:

- If friendScore >= threatScore + 30: AI is a friend

- If threatScore >= friendScore + 30: AI is a threat

- Otherwise: AI is both

TECHNICAL REQUIREMENTS

- Clean TypeScript types.

- Reusable components.

- No unnecessary external dependencies except Framer Motion.

- No backend for MVP.

- Store name and progress in localStorage.

- Add reset functionality.

- Make sure there are no hydration errors.

- Make sure the project builds successfully.

- Use semantic HTML where possible.

- Buttons must be keyboard accessible.

- Alt text for Byte image.
- Text must be readable over backgrounds using overlays.

ASSETS

Use these paths:

```
/images/hero-jungle.webp
/images/zone-education.webp
/images/zone-healthcare.webp
/images/zone-business.webp
/images/zone-daily-life.webp
/images/final-temple.webp
/images/byte-cat.png
/images/fog-overlay.webp
/images/noise.png
```

If images are missing, use CSS gradient placeholders but keep the paths and structure ready.

OUTPUT EXPECTATIONS

Build a working first version with:

- Name input
- Byte guide
- Four zones
- Choice logic
- Score updates
- Visual reactions
- Final verdict
- Presentation Mode
- Responsive layout

After implementing, run:

```
npm run lint
```

```
npm run build
```

Fix errors before finishing.

4. AGENTS.md content

Create this file in the root of the repository. Codex should read it as durable project guidance.

```
# AGENTS.md — Into the AI Jungle
```

Project

This project is an interactive educational website for an English course final project.

Title: Into the AI Jungle

Topic: Artificial Intelligence: Friend or Threat?

Product idea

The website is a cinematic jungle expedition. The user enters their name, meets a techno-cat guide named Byte, moves through four AI zones, makes choices, sees consequences, receives scores, and reaches a final verdict.

Stack

- Next.js App Router
- TypeScript
- Tailwind CSS

- Framer Motion
- No backend for MVP

Design direction

Use cinematic jungle + subtle technology.

This is not a neon cyberpunk dashboard.

Use dark forest backgrounds, warm gold trail light, soft emerald accents, muted red for danger, dark glass cards, readable typography, and clean spacing.

Do not

- Do not create an overloaded dashboard.
- Do not use heavy neon everywhere.
- Do not place text inside generated images.
- Do not make text tiny.
- Do not hard-code all content inside components.
- Do not add backend unless explicitly requested.
- Do not use real AI responses for Byte. Byte uses predefined messages only.

Required flow

Name input → Byte greeting → Journey Map → Education → Healthcare → Business → Daily Life → Final Temple → Final Verdict.

Required components

Hero, NameIntro, TechnoCat, JourneyMap, Checkpoint, ChoiceCard, AICompass, FinalVerdict, PresentationModeToggle.

Data files

Use src/data/zones.ts for content.

Use src/data/catMessages.ts for Byte responses.

Use src/data/assets.ts for image paths.

Use src/lib/verdict.ts for verdict logic.

Quality bar

The site must be stable, responsive, presentation-friendly, and easy to show on a projector.

Run lint and build after major changes.

5. README.md content

Into the AI Jungle

Interactive website for the English final project “Artificial Intelligence: Friend or Threat?”.

The project guides users through a cinematic jungle journey where they explore how AI affects education, healthcare, business, and daily life. Users make choices, receive feedback from Byte the techno-cat guide, and get a final verdict: AI is a friend, a threat, or both.

Stack

- Next.js
- TypeScript
- Tailwind CSS
- Framer Motion

Main features

- Name input and personalized journey
- Floating techno-cat guide named Byte

- Four AI zones
- Responsible vs dangerous AI choices
- Friend/Threat/Responsibility scores
- Final verdict
- Presentation Mode
- Responsive design

Core message

AI is a friend when it supports people. AI is a threat when it replaces human thinking, privacy, honesty, and responsibility.

6. Codex task sequence

Do not give Codex everything as one vague request. Use the master prompt first, then continue with focused tasks.

Step	Codex task	Expected result
1	Create the project structure and files.	Next.js project with components, data files, and placeholder UI.
2	Implement the core logic.	Name input, localStorage, choices, score updates, final verdict.
3	Implement Byte.	Floating cat with predefined messages and name personalization.
4	Implement design system.	Cinematic jungle style, glass cards, gold/emerald palette.
5	Add animations.	Floating Byte, smooth transitions, glow/glitch reactions.
6	Add Presentation Mode.	Readable projector mode with reduced motion and larger text.
7	Add asset integration.	Use exact files from public/images.
8	QA and build.	npm run lint and npm run build pass.
9	Deploy.	Push to GitHub and deploy on Vercel.

Task 1 — Scaffold

Create the initial Next.js + TypeScript + Tailwind + Framer Motion project structure for Into the AI Jungle. Add the required components and data files. Use placeholder images from /public/images and make sure the app runs.

Task 2 — Logic

Implement the full interaction logic: name input, localStorage, four checkpoints, responsible/dangerous choices, score updates, current checkpoint tracking, and final verdict calculation.

Task 3 — Byte

Implement TechnoCat Byte as a floating companion. Byte should use /images/byte-cat.png, float gently with Framer Motion, show a speech bubble, and use predefined messages from catMessages.ts based on the user's name and choices.

Task 4 — Visual design

Redesign the UI according to the cinematic jungle concept: dark forest atmosphere, warm gold trail light, soft emerald details, muted red warnings, glass cards, clean spacing, large typography. Avoid the heavy neon dashboard look.

Task 5 — Presentation Mode

Add Presentation Mode. It should enlarge text, reduce motion, improve contrast, and make the site stable and readable on a projector during a 7-8 minute presentation.

Task 6 — Final polish

Polish responsiveness, keyboard accessibility, alt text, motion smoothness, and visual consistency. Then run `npm run lint` and `npm run build` and fix all issues.

7. Image generation prompts

Use these prompts when generating images. Generate assets without text, buttons, logos, or UI labels. Save them with the exact filenames listed below.

hero-jungle.webp

Cinematic dark jungle pathway at dawn, mysterious ancient forest, warm golden light on a narrow trail leading into depth, soft fog, subtle futuristic details hidden in vines, premium film still atmosphere, realistic lush vegetation, no text, no UI, no logos, wide 16:9 composition, clean center area for website text overlay.

zone-education.webp

Cinematic jungle classroom ruins, old wooden desk, books, chalkboard covered with abstract marks not readable text, laptop with soft warm glow, vines and leaves around, subtle technology elements, dark green forest atmosphere, premium realistic style, no text, no UI, no logos, wide 16:9.

zone-healthcare.webp

Cinematic jungle medical camp, canvas tent, soft warm light, medical scanner with subtle futuristic glow, plants and mist, caring but serious atmosphere, no readable text, no UI, no logos, wide 16:9 realistic premium scene.

zone-business.webp

Cinematic jungle market of machines, forest trading post with subtle holographic charts without readable text, crates, small robotic helpers, warm lights, dark premium jungle atmosphere, no UI, no logos, wide 16:9.

zone-daily-life.webp

Cinematic mirror lake in a dense jungle, a phone reflection in water, subtle icons as abstract glowing shapes but no readable text, calm mysterious atmosphere, soft gold and emerald light, realistic premium style, no UI, no logos, wide 16:9.

final-temple.webp

Cinematic ancient temple in deep jungle, warm golden light at the entrance, path leading to a final gate, soft mist, subtle futuristic

Use this document as the master context for Codex, GitHub, and Vercel.

compass symbol carved abstractly but no text, premium realistic style, no UI, no logos, wide 16:9.

byte-cat.png

Small floating techno-cat companion named Byte, cute but premium, dark graphite metal body, soft warm-green glowing eyes, subtle circuit details, tiny paws, expressive face, not too childish, transparent background, no text, no logo, centered full body character, high quality asset for website UI.

fog-overlay.webp

Subtle transparent-looking fog and mist overlay for a dark jungle website, soft haze, no objects, no text, no logo, wide image.

8. Detailed implementation notes

Recommended component responsibilities:

Component	Responsibility
Hero.tsx	Main entrance screen, background, title, subtitle, NameIntro, CTA.
NameIntro.tsx	Name input, validation/fallback, save name, start journey.
TechnoCat.tsx	Floating Byte image, speech bubble, animation, current message.
JourneyMap.tsx	Entrance and checkpoints; active/completed state.
Checkpoint.tsx	Renders one zone using data from zones.ts.
ChoiceCard.tsx	Responsible/Dangerous choice UI and click handling.
AICompass.tsx	Sticky score panel and score visualization.
FinalVerdict.tsx	Final result, 5 laws, restart, optional badge.
PresentationModeToggle.tsx	Toggles presentation-friendly UI state.

```
// Suggested Zone Type
export type ZoneId = "education" | "healthcare" | "business" | "dailyLife";

export type Zone = {
  id: ZoneId;
  areaTitle: string;
  placeName: string;
  background: string;
  question: string;
  opportunity: string;
  risk: string;
  responsibleChoice: string;
  dangerousChoice: string;
  responsibleConsequence: string;
  dangerousConsequence: string;
};
```

```
// Suggested Score State
export type ScoreState = {
```

```
friendScore: number;
threatScore: number;
responsibilityScore: number;
choices: Record<string, "responsible" | "dangerous" | undefined>;
};
```

```
// Suggested verdict logic
export function getVerdict(friendScore: number, threatScore: number) {
  if (friendScore >= threatScore + 30) return "friend";
  if (threatScore >= friendScore + 30) return "threat";
  return "both";
}
```

9. Short presentation script for the website demo

Use this during the defense. Keep it natural and do not read every word.

Today we are not showing only a normal presentation. We created an interactive website called Into the AI Jungle.

The jungle is a metaphor. Artificial intelligence is powerful and useful, but it can also be dangerous if people use it without responsibility.

First, the user enters a name. Then Byte, our techno-cat guide, leads the user through four areas: education, healthcare, business, and daily life.

In every area, the user makes a choice. A responsible choice shows how AI can be a friend. A dangerous choice shows how AI can become a threat.

Byte is not real AI. It uses predefined responses based on the user's choices. We added it to make the website more personal and interactive.

At the end, the website shows the final verdict. Our main idea is simple: AI should support human intelligence, not replace it.

10. Final QA checklist

- The site opens from a public Vercel link.
- The name input works and loads from localStorage.
- Byte appears and uses the user name correctly.
- All four zones work: Education, Healthcare, Business, Daily Life.
- Responsible and dangerous choices update the correct scores.
- Byte comments change after every choice.
- Glow and warning/glitch reactions are visible but not annoying.
- Final Verdict calculates correctly.
- Presentation Mode works and improves readability.
- Mobile layout is usable.
- Laptop/projector layout is readable.
- No text is embedded inside background images.

- No broken image paths.
- npm run lint passes.
- npm run build passes.
- GitHub repository is clean and has README.md and AGENTS.md.

11. Important reminders

- Build the MVP first. Do not start with advanced animations before the logic works.
- Keep the site stable. A simpler working site is better than an overloaded broken site.
- Use exact asset filenames so you can replace generated images without changing code.
- The website must support the presentation, not compete with it.
- The strongest product idea is: Choice → Consequence → Score → Verdict.
